ACKNOWLEDGEMENT

The success and final outcome of this project required a lot of guidance and assistance from many people and we are extremely fortunate to receive such help throughout the project. What we have done is only due to such guidance and assistance and we would not forget to thank them.

We express our sincere gratitude to Dr. Sr. Rosy Joseph fmm, M.Sc., M.Phil., Ph.D., Principal, Stella Maris College (Autonomous) for giving us this wonderful opportunity for doing this project.

We owe our profound gratitude to Ms. Birunda Antoinette Mary J, M.Sc., B.E d., M.Phil., Head, Department of Computer Science, for supporting and encouraging us.

We would like to express our special gratitude to our project Ms. Birunda Antoinette Mary J, M.Sc., B.E d., M.Phil., for helping us with valuable suggestions and for her continuous support and encouragement throughout this project.

We extend our heartfelt thanks to our parents and friends for providing their support in this endeavour of ours.

ABSTRACT

Athenaeum is a user-friendly mobile app designed to make library management much simpler with contact-free functionality. It was created with the current pandemic crisis in consideration. A time when people's reliance on technology has grown exponentially over the past year. This application allows students to self-issue books, return them, view their issues, pay fines, and even access and download books from all years of the curriculum. The librarian, on the other hand, can scan or manually issue books to students, view student's book issues, return them, and browse for books in the curriculum. This application is beneficial for the department, as it reduces students' reliance on the librarians and allows librarians to keep track of student orders and the defaulters without having to rely on book registers.

1. INTRODUCTION

With over 250 students in the department, our application could help make library management a lot less demanding. We implemented book issuing and returning via scanning and fine payments using no cash, inspired by our library's protocols. Students can even ask their friends to issue books for them without any hassle, and they can preview the books prescribed for their next semester ahead of time to familiarise themselves with them. This application is the need of the hour, as maintaining a contactless system is critical during these testing pandemic times. This application benefits the department because it decreases student dependence on librarians and helps librarians to keep track of student orders and defaulters without relying on book registers.

2. PROJECT REQUIREMENTS AND SPECIFICATION

2.1 Requirement Analysis – Proposed System

Existing System

Issuing and returning of books and making fine payment is only possible in the presence of a Librarian.

Proposed System

The proposed system provides a contactless solution for the Departments of Stella Maris College. Students can self issue books, make late return fine payments through UPI payment gateways and search for books prescribed in all the years syllabus and Librarians can view the student issues and also do the issuing and returning of books.

User Specifications

- Students and librarians register with their personal details in order to access their accounts.
- They can then login to access the app's various functionalities and functions after registering.

Student has the following features:

- **Issue book:** Helps students borrow books by scanning the barcode/QR of the book, similar to how the existing library management system works.
- **My Books:** It is an alternate method of manually issuing books if the scanning function on the student's phone does not operate, allowing students to issue books by manually entering the information.
- **Search Book:** Assists students in accessing or downloading e-books that are prescribed for all years of the curriculum.
- **Fine Payments:** Allows the student to make late return fine payments for books using the UPI payment gateways built into the student's phone.
- **Settings:** Assists the student with changing their password.

Librarian has the following features:

- **Issue Book (Scanning):** By scanning the book's barcode/QR code, it assists the librarian in issuing a book to the student.

- **Issue Book (Manually):** Assists the librarian in issuing a book to a student by manually entering the book's information.
- **View and Return Books:** Assists the librarian in viewing and deleting the student's book issue records in the event that the student has returned the book.
- **Search Book:** Assists librarians in accessing or downloading e-books for all years of the student programme.
- **Settings:** Assists the librarian with changing their password.

2.2 Feasibility Study

Technical Feasibility

This evaluation determines whether the technology needed for the proposed system is available or not. This is concerned with specifying and software that will successfully satisfy the user requirement. The technical needs of the system may include:

- Front-end Selection - Java and XML (Android Studio)
- Back-end Selection – SQLite

The technical requirements are fulfilled and are technically feasible

Operational Feasibility

This system can be used by the students of Stella Maris College with just a mobile phone. Hence the system is operationally feasible for the end user to operate.

Economic Feasibility

Economical justification is generally the “Bottom Line” consideration for most systems. This feasibility checks whether the system can be developed with the available funds. This project is developed with minimum funds and is economically feasible.

2.3 Hardware and Software Specifications

Software Specifications

Front End	Android Framework
Back End	SQLite
Operating System	Microsoft Windows 7/8/10 (64-bit)
Platform	Android SDK
IDE	Android Studio
Android Emulator	API Level 21/Higher
Technologies	Java, XML

Table 2.3.1: Software Specifications

Hardware Specifications

Processor	Core i5 or i3
Memory Space	8 GB
Disk Space	4 GB
CPU Speed	2.30 GHz

Table 2.3.2: Hardware Specifications

3. SYSTEM ANALYSIS

System analysis is a management exercise which helps us in diagnosing a new system or improving the existing system. The analysis includes system study and UML diagrams explaining the working of the system. The software and tools used in the system are as follows.

Android Framework

Android Studio is the official integrated development environment (IDE) for Google's Android operating system, built on JetBrains' IntelliJ IDEA software and designed specifically for Android development. Android Studio supports all the same programming languages of IntelliJ (and CLion) e.g, Java, C++, and more with extensions, such as Go; and Android Studio 3.0 or later supports Kotlin.

Android Studio

Android Studio is the official integrated development environment (IDE) for Google's Android operating system, built on JetBrains' IntelliJ IDEA software and designed specifically for Android development. It is a replacement for the Eclipse Android Development Tools (ADT) as the primary IDE for native Android application development.

SQLite

SQLite is an open-source SQL database that stores data to a text file on a device. Android comes with built in SQLite database implementation. It is used to perform database operations on android devices such as storing, modifying, retrieving persistent data from databases.

3.1 System Study

The main goal of this Android application is enhancing the library management system in all departments of Stella Maris College. Making it easier for the department's libraries by allowing students to self-issue and return books and make late fine payments without the involvement or dependence of the librarian. Librarians, on the other hand, can remotely track all of a student's book issues and can easily track the defaulters. And to prevent unauthorised access to student information, a special code must be entered in order to display the functionality available to the librarian, ensuring data protection.

3.2 UML Diagrams

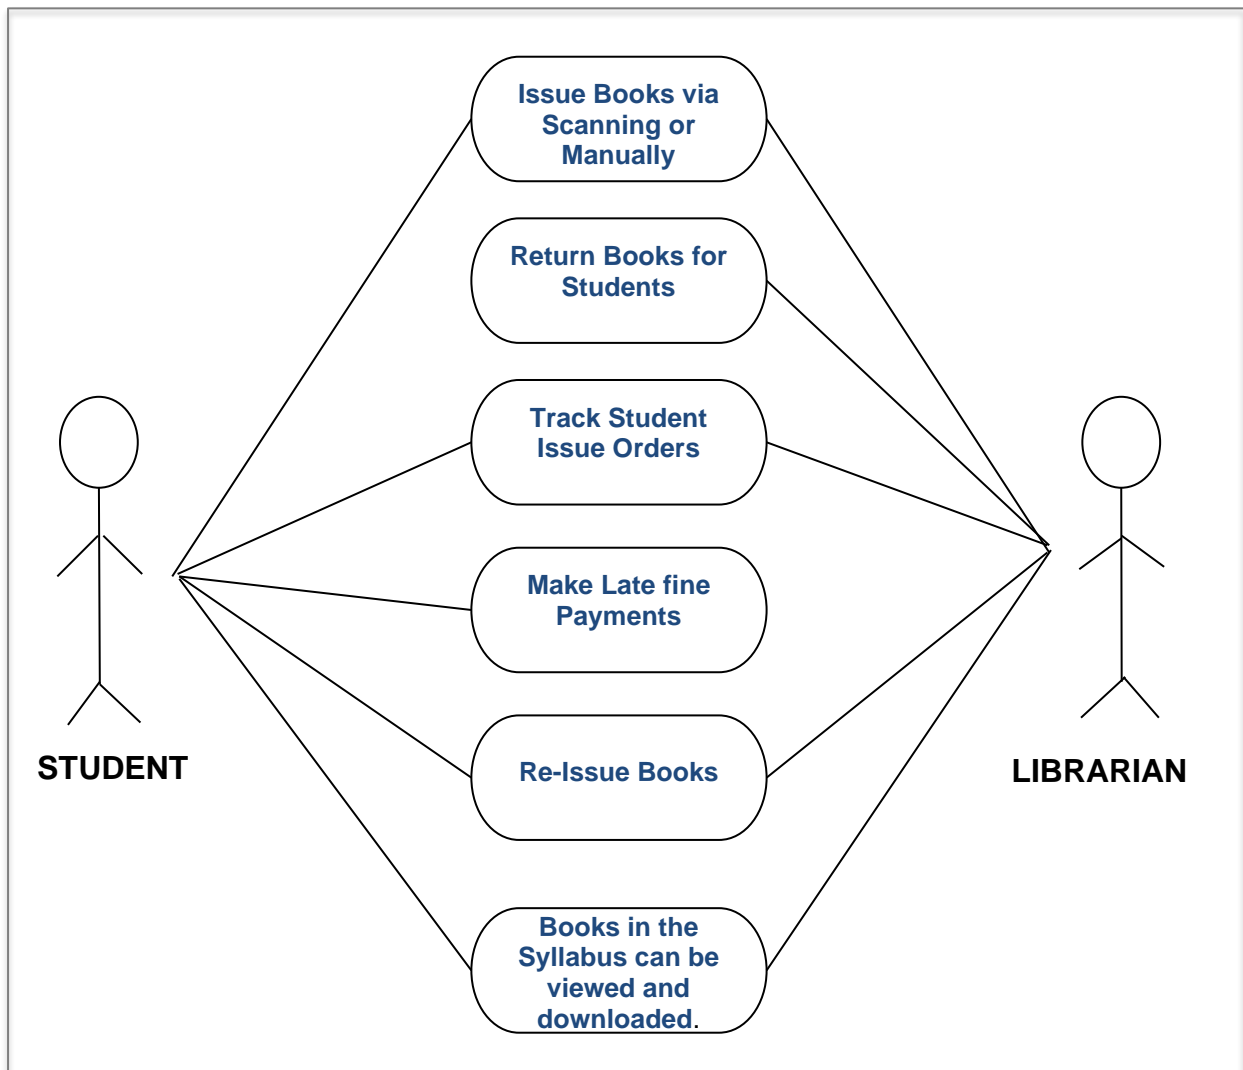

Fig 3.2.1: Use Case Diagram

Use case diagrams are usually referred to as diagrams used to describe a set of actions (use cases) performed by user.

This use case diagram is used to describe a set of actions (use cases) performed by the Student and Librarian onTouch of the specific images in the CATEGORIES pages.

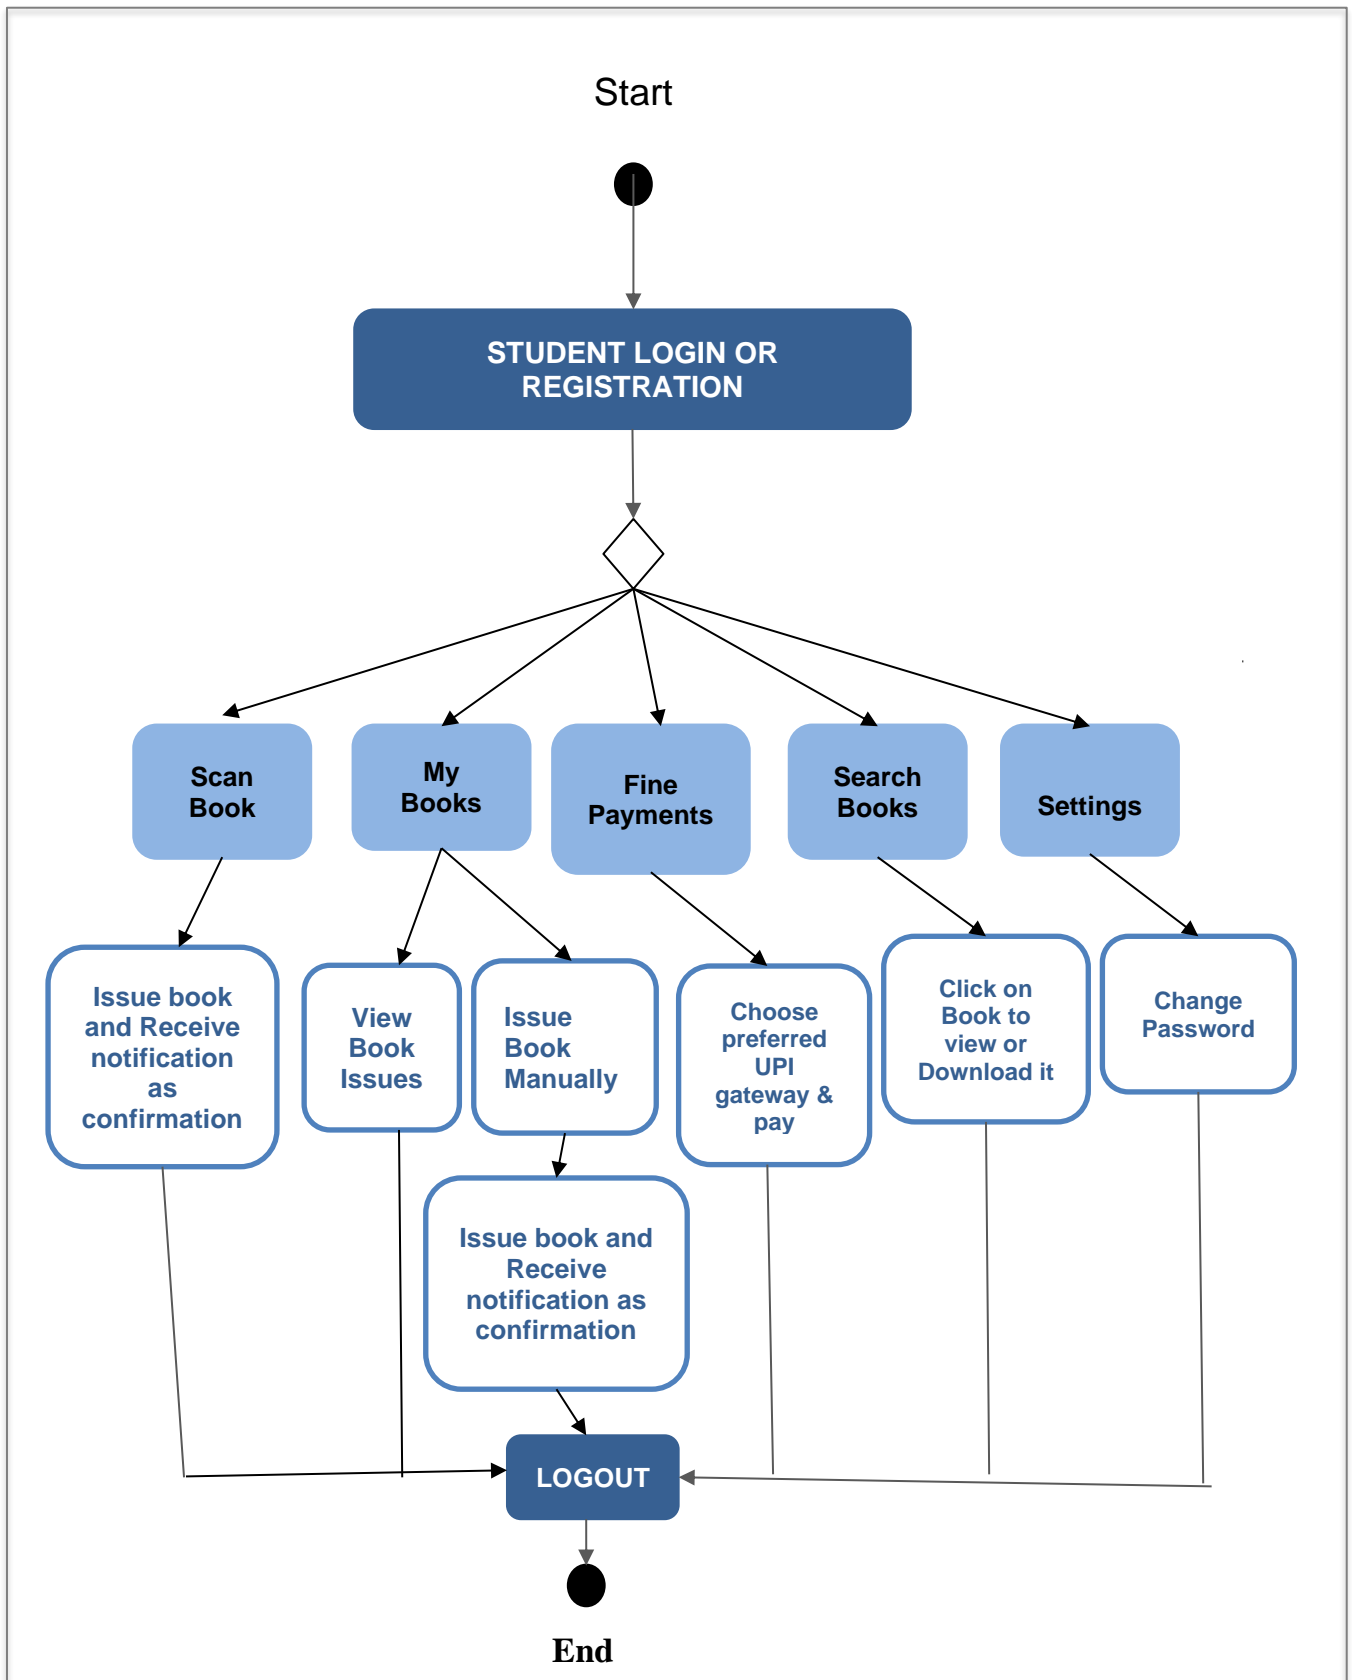

Fig 3.2.2: Activity Diagram-Student

This activity digram describes the actions that could be performed by the Student in a sequential manner.

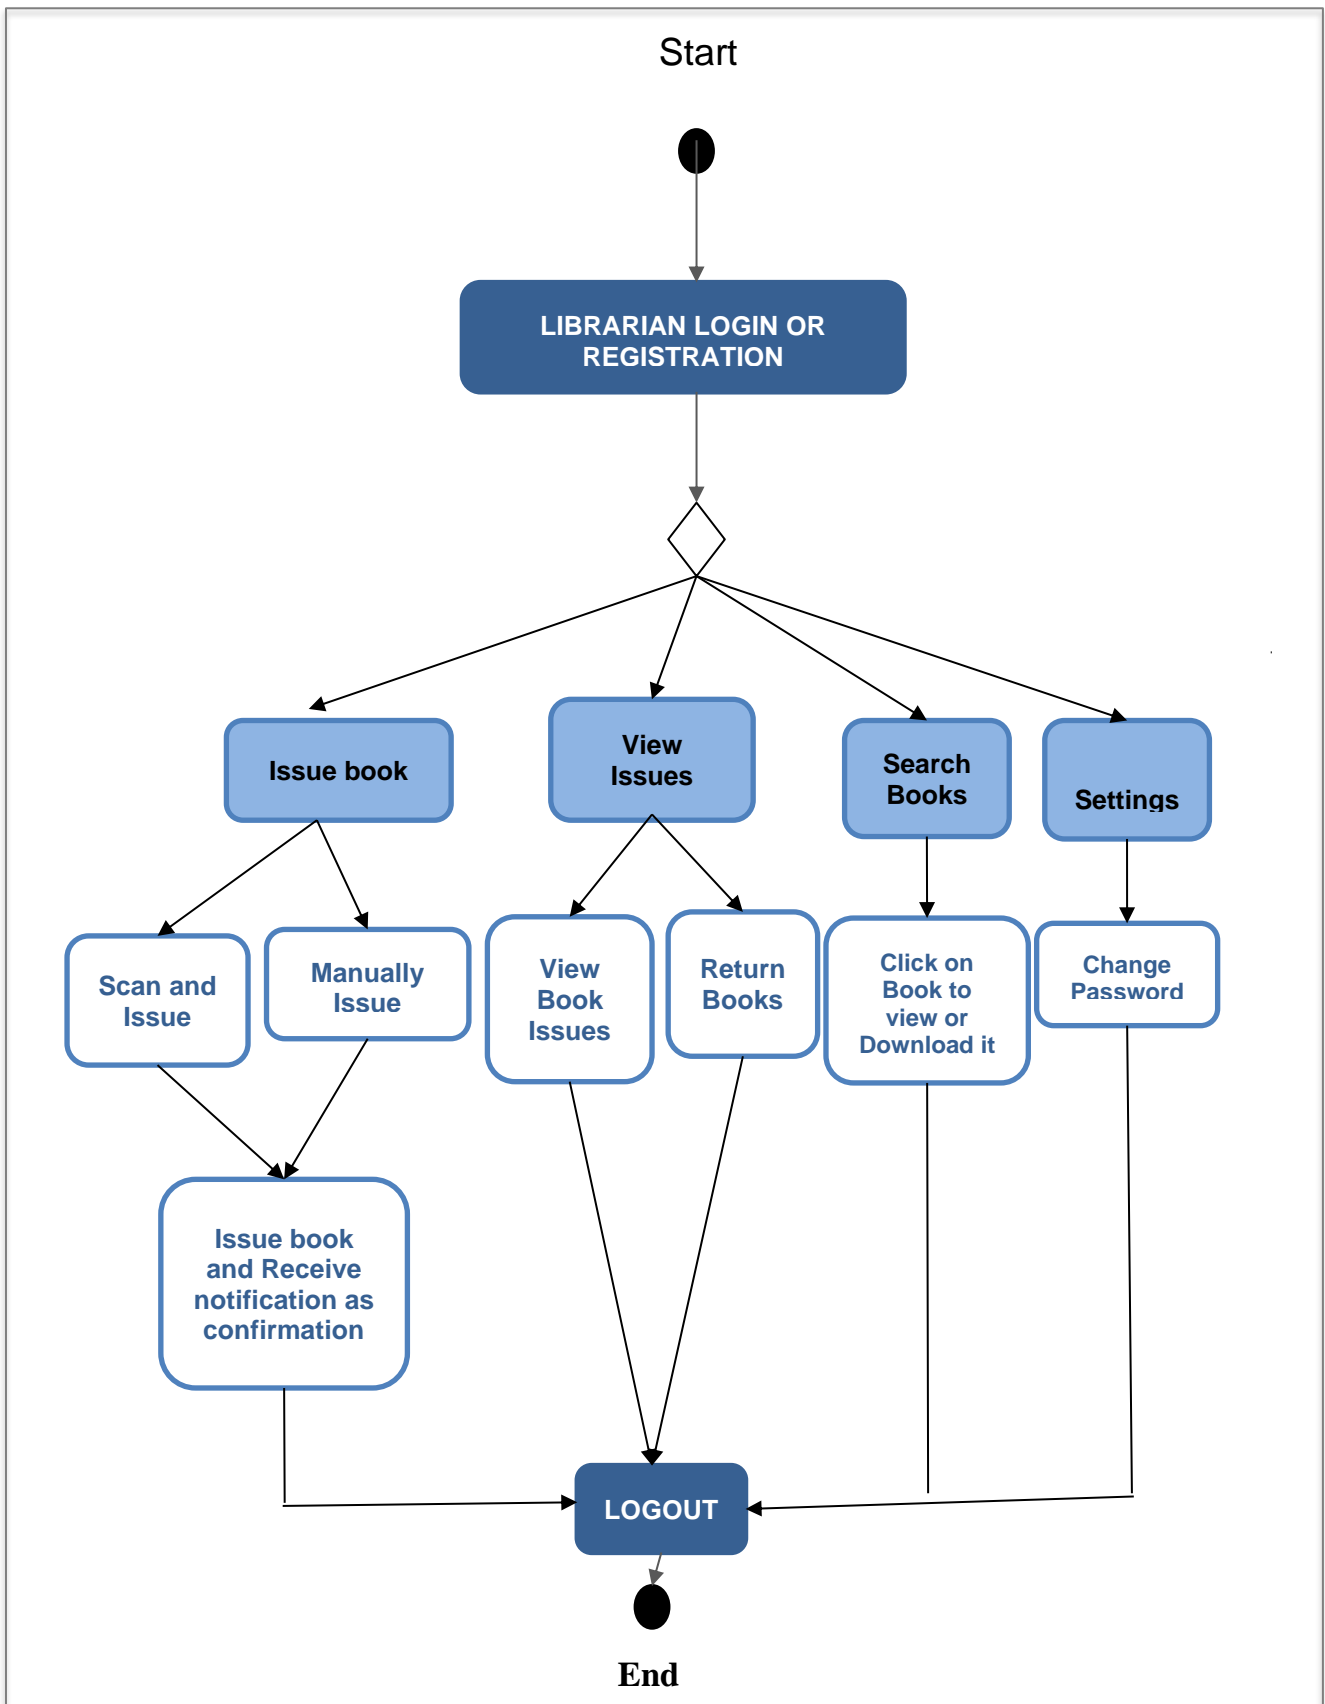

Fig 3.2.3: Activity Diagram-Librarian

This activity diagram describes the actions that could be performed by the Librarian in a sequential manner.

3.3 Data Dictionary

BOOKDB			
Description	This table contains the Issued Book's Details.		
Attribute	Description	Type	Example Values
BKID	Book's Barcode or QR Code.	Integer (PK)	87638689012
BNAME	Name of the Book.	Varchar (NOT NULL)	Java: The Complete Reference
BDATE	Date of Book Issue.	Varchar (NOT NULL)	14 Apr 2021
RDATE	Date of Book Return.	Varchar (NOT NULL)	21 Apr 2021
bkSID	Student's Department number	Varchar (FK)	18/UCSA/201

STUDB			
Description	This table contains the Student Details.		
Attribute	Description	Type	Example Values
SID	Student's Department Number.	Varchar (PK)	18/UCSA/201
UNAME	Name of the Student.	Varchar (NOT NULL)	Furika Miki
PASSWORD	Student account's password.	Varchar (NOT NULL)	Helloworld@123

LIBDB			
Description	This table contains the Librarian's Details.		
Attribute	Description	Type	Example Values
LID	Librarian's email id.	Varchar (PK)	maris12@gmail.com
LNAME	Name of the Librarian.	Varchar (NOT NULL)	Maris Paris
LPASS	Librarian account's password.	Varchar (NOT NULL)	marisa@456

SearchDB			
Description	This table contains the Book' Details of the Search function.		
Attribute	Description	Type	Example Values
bookName	Name of Book.	Varchar (PK)	C Programming
authorName	Name of the Author.	Varchar (NOT NULL)	By Balagurusamy
imageUrl	Image of the book.	Integer	R.drawable.img

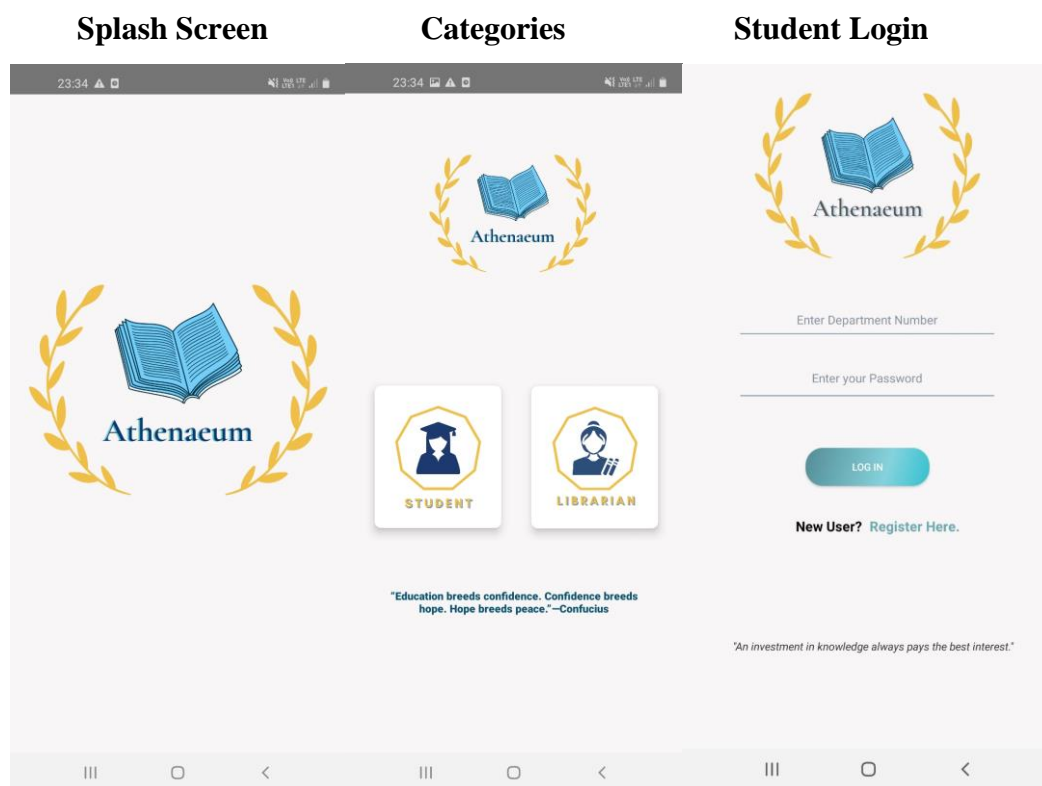

4. SYSTEM DESIGN

4.1 Introduction

System design is the process of defining the architecture, components, modules, interfaces, and data for a system to satisfy specified requirements. The design of our system consists of the following:

- Screen design - screenshots of the application
- Database design - description of the tables

6. TESTING

After generating the code, we started on with program testing. The testing process generally focuses on the logic (internal) of the software ensuring that all the statements have been tested, and on the functional externals, that is we conducted tests to uncover errors and ensure that defined input will procedure actual results that agree with the required results.

Sample Test Cases

Screen name: Categories (Student/Librarian)

Test case id: 1

Test name: Verify identity

Purpose: Ensure that either student/librarian can use the app

Pre-Condition: None

Sl. No	TEST CASE	EXPECTED RESULT	ACTUAL RESULT	STATUS
1	Click on Student Image Button	Goes to Student Login Page	Goes to Student Login Page	SUCCESS
2	Click on Librarian Image Button	Goes to Librarian Login Page	Goes to Librarian Login Page	SUCCESS
3	Click of Back Button on Phone	Exits the App.	Exits the App.	SUCCESS

Post-Condition: Student/Librarian login will appear

Valid test data: None

STUDENT TEST CASES

Screen name: User Login

Test case id: 2

5	On-click of BACK button	Goes to LANDING PAGE	Goes to LANDING PAGE	SUCCESS

Post-Condition: New Password updated in the database.

Valid test data: Valid current password

7. SYSTEM IMPLEMENTATION

The purpose of system implementation are as follows: The implementation stage involves careful planning, investigation of the existing system and its constraint on implementation, designing of the methods to achieve change over and evaluation of change over methods. The application is designed to be used by a student of Stella Maris College. The user logs into their account which is created through their department numbers. The user can issue books either through scanning method or by manual method. They can also search for books present in the app and download a copy into their device. They will be receiving notifications to return their books on the correct dates. The same process works for the librarian too but they need to register themselves with a special code. In addition, the librarian can delete the student record from the database if she has returned the book. If the book has been returned after the due date a fine amount has to be paid based on the number of days after the due date. Both the student and librarian have the feature to update their passwords in their account.

8. FUTURE ENHANCEMENTS

The project's future potential is enormous. The following is the project's potential reach:

- The project should be extended to provide a scanning system for returning books so that the librarian can use them.
- Searching functionality by author name may also be added to make it easier for students and librarians to find books if they forget the title.
- SQLite is the database that was used. Since the database used was SQLite, the functionalities were limited; however, had we used Firebase, the possibilities would have been endless. For example, dynamically changing the special code periodically which is essential for a librarian to sign up or even dynamically add new books to the search bar.
- The project can be hosted on Google Play Store and be commercialised.
- And most importantly, this project can be made available for all departments of Stella Maris College.

9. CONCLUSION

The main aim of our project is to make it easier for students to use the library's resources without having to rely on the librarian. Since the whole cumbersome process is made simple with the android application. This will help departments that depend on registers, a designated student librarian and computers manage their libraries better. It's a win-win situation for both students and librarians especially during the pandemic where development of contactless systems has become a necessity.
